

Problem:

Build a web application for rating movies and tv shows.

Features required:

1. User should be able to search for movies or TV shows from a search input.
2. List the search result, for both TV shows and movies.
3. On clicking any of the search results, user should be navigated to movie/tv_show detail page.
4. On the detail page, user should be able to rate them from 0.5-10 in increment of 0.5 .
5. A “My Ratings Page” should be available for the user, to see all his ratings.

Candidate will have to use <https://developers.themoviedb.org/> API.

To be able to submit ratings, API needs a session_id or guest_session_id, candidate can choose either of them.

How to submit code?

Submit us links to the github repository and link where it's hosted.

Application's code should be in a github repository.

Web application should be hosted in some static page hosting service like netlify, github etc.
